1. All cancers consist of cells in which growth and reproduction have become uncontrolled, and which can destroy healthy cells.
2. Cells depend on hormones in order to continue growing.

Healthy liver cells

Cancer in liver cells

1. There are many different kinds of cancer. What do they have in common?
2. Some new cancer therapies focus on starving cancer cells of hormones. Why might this work?
3. What might be some reasons the body controls the growth and reproduction of healthy cells?
