

3. Answers will vary. Students might understand that the animal was prey for other animals.

1. Answers will vary. Students might suggest that they could learn something about the animal's size or shape, or they might think that they need more information.

2. Answers will vary. Students might still want more information, or they might speculate that the bone must belong to a species that is, or was, common in the area.

1. If you were to find the fossil bone in the photo, what features of the animal do you think you could identify?
2. If you learned that similar bones are commonly found in your area, would that help you learn more about the animal?
3. If you learned that bones like these are often covered with teeth marks, what would that help you to understand ?
